For OS X:

1. Open up the ‘Print Center’. This application is found in the ‘Utilities’ folder, usually within the ‘Applications’ folder (OS X Applications, not OS 9) on the hard drive.

2. If no printers are installed, a window pops up asking if you want to add a printer. Click on Add.
If a printer is already installed and you are adding a new printer, the Print Center window will open, just click on ‘Add Printer’.

On the next window, from the drop down list, select ‘LPR Printing using IP’.

3. Type in the printers IP address in the first box. Uncheck the ‘Use Default Queue on Server’ and then type in the Queue Name of the printer. From the ‘Printer Model’ drop down box select the correct printer model. Click ‘Add’.

If you have typed in the wrong address or queue, a message will appear saying ‘Unable to Verify the Printer Address”.

- If the printer description is not there, it will need to either be downloaded from the web or installed from the disk that came with the printer.
4. Print a test page. In OS X, no printer is mounted on the desktop. To view printers, you must open the ‘Print Center’.
